

Welcome to the Preventive Medicine Center!

- + This is the summary of your answers to the Health Checker, registered on October 28 in 2023.

The results of the Health Checker are based on your answers. This report is not a medical diagnosis, nor is intended to replace clinical assessment performed by a health professional.

Biometric data and other information

 Male
  Age **>70**
 Weight **66 Kg**
 Height **1,70 m**

BMI	BODY FAT CONCENTRATION	SMOKING LOAD	YEARS W/O SMOKING
22,8 (Body Mass Index)		40,0 (Pack units per year)	-

- + At this age, it is critical to be physically and mentally active. The follow-up by a dedicated medical team, with strict surveillance, allows the control of chronic diseases and helps maintain the maintain the quality of life.
- + Your BMI (Body Mass Index) value indicates that you have a normal body weight (18.5 to 24.9 kg/m²). However, please note that this index does not distinguish lean mass, fat mass, bone density and fluids, nor their distribution. The interpretation of the BMI should be associated with other indicators such as: waist circumference, and any particular health condition, or other physiological state
- + According to the image you have chosen, you identified yourself with thinness. If you are concerned that you are underweight, you should consult your doctor. The risk of cardiovascular and metabolic diseases increases when the waist circumference is greater than 80 cm in women and 94 cm in men.
- + It is important to quit smoking. The smoking load is the quantification of tobacco exposure throughout life. A pack-year unit is equivalent to one pack of cigarettes smoked everyday, for a year. Any smoking load is harmful to health. Smoking is associated with the main causes of death in the world. A long-term active smoker loses, on average, 10 years of life.

Health problems

- + You replied that you have some health problems/concerns, so you should be followed up by your doctor and/or health team.

 Fatigue

 High cholesterol

Family history of disease

- + Genetic predisposition can cause or aggravate certain diseases. Sharing your family history of illness with your healthcare team enables an early diagnosis and the adoption of a personalized care plan, minimizing risks.
 - Doença oncológica (cancro)
- + If someone in your immediate family has cancer, you should assess your individual risk with your doctor.

Cardiovascular risk factors

 High cholesterol

 Smoking

- + Cardiovascular diseases are one of the major causes of mortality and poor quality of life.
- + The main risk factors are: high blood pressure, high cholesterol, diabetes, overweight, large waist circumference, smoking and a family history of disease. Keep a proactive surveillance of these risk factors.
- + When 1 risk factor exists, cardiovascular risk is already considered to exist.

Health habits and lifestyle

- + A healthy lifestyle is essential to have quality of life, today and in the future, which implies having a healthy and balanced diet, avoiding sedentary behavior and practicing physical exercise, controlling the levels of stress, maintaining good sleep routines, avoiding alcohol consumption and not smoking.
- + Your daily choices make a difference.
- + Your answers indicate that you have an adequate lifestyle, with aspects that you can improve. However, to quit smoking is essential for your health.
