

Welcome to the Preventive Medicine Center!

- + This is the summary of your answers to the Health Checker, registered on November 09 in 2023.

The results of the Health Checker are based on your answers. This report is not a medical diagnosis, nor is intended to replace clinical assessment performed by a health professional.

Biometric data and other information

Female

30-39

80 Kg

1,66m

BMI

29,0

(Body Mass Index)

BODY FAT CONCENTRATION

SMOKING LOAD

9,0

(Pack units per year)

YEARS W/O SMOKING

-

- + At this age, you should annually check the values for the main cardiovascular risk factors (weight, cholesterol, diabetes, and blood pressure), maintain gynecology follow-up, watch out for excesses (diet, smoking, alcoholic beverages), and manage the stress levels.
- + Your BMI (Body Mass Index) value indicates that you are above normal body weight, meaning overweight (25.0 a 29.9 kg/m²). However, please note that this index does not distinguish lean mass, fat mass, bone density and fluids, nor their distribution. The interpretation of the BMI should be associated with other indicators such as: waist circumference, and any particular health condition, or other physiological state (example: pregnancy or postpartum).
- + According to the image you have chosen, you have localized fat in the abdomen, which is a risk factor for the development of diseases (cardiovascular, diabetes and other). The risk increases when the waist circumference is greater than 80 cm in women and 94 cm in men.
- + It is important to quit smoking. The smoking load is the quantification of tobacco exposure throughout life. A pack-year unit is equivalent to one pack of cigarettes smoked everyday, for a year. Any smoking load is harmful to health. Smoking is associated with the main causes of death in the world. A long-term active smoker loses, on average, 10 years of life.

Health problems

- + You did not indicate the existence of any health problem/concern. You indicated Pregnancy, which is a physiological state that must have specialized medical follow-up. Any condition (or symptom) should be discussed with the doctor, who is following up your pregnancy.

No health problems / concerns

Current pregnancy

Family history of disease

- + Genetic predisposition can cause or aggravate certain diseases. Sharing your family history of illness with your healthcare team enables an early diagnosis and the adoption of a personalized care plan, minimizing risks.
- + You replied that you have no family history of cancer, neurological and cardiovascular disease.

Cardiovascular risk factors

Smoking

- + Cardiovascular diseases are one of the major causes of mortality and poor quality of life.
- + The main risk factors are: high blood pressure, high cholesterol, diabetes, overweight, large waist circumference, smoking and a family history of disease. Keep a proactive surveillance of these risk factors.
- + When 1 risk factor exists, cardiovascular risk is already considered to exist.

Health habits and lifestyle

- + A healthy lifestyle is essential to have quality of life, today and in the future, which implies having a healthy and balanced diet, avoiding sedentary behavior and practicing physical exercise, controlling the levels of stress, maintaining good sleep routines, avoiding alcohol consumption and not smoking.
- + Your daily choices make a difference.
- + Your answers indicate that you should review some of your habits and lifestyle, and to quit smoking is essential.

lorem

- + Hospital da Luz has multidisciplinary teams that can follow you up and guide you in everything related to your health.
