

Welcome to the Preventive Medicine and Longevity Center

- + This is the summary of your answers to the Health Checker, registered on november 15 in 2023.

The results of the Health Checker are based on your answers. This report is not a medical diagnosis, nor is intended to replace clinical assessment performed by a health professional.

Biometric data and other information

Female

50-59

65 Kg

2,50 m

BMI

10,4

(Body Mass Index)

BODY FAT CONCENTRATION

SMOKING LOAD

165,0

(Pack units per year)

YEARS W/O SMOKING

-

- + At this age, it is essential to control the stress levels and the values for the main cardiovascular risk factors (weight, cholesterol, diabetes, and blood pressure), and carry out the recommended cancer and gynecological screenings (breast, uterus, ovaries, and colon).
- + Your BMI (Body Mass Index) value indicates that you are below normal body weight (less than or equal to 18.5 kg/m²). However, please note that this index does not distinguish lean mass, fat mass, bone density and fluids, nor their distribution. The interpretation of the BMI should be associated with other indicators such as: waist circumference, and any particular health condition, or other physiological state (example: pregnancy or postpartum).
- + According to the image you have chosen, you identified yourself with thinness. If you are concerned that you are underweight, you should consult your doctor. The risk of cardiovascular and metabolic diseases increases when the waist circumference is greater than 80 cm in women and 94 cm in men.
- + It is important to quit smoking. The smoking load is the quantification of tobacco exposure throughout life. A pack-year unit is equivalent to one pack of cigarettes smoked everyday, for a year. Any smoking load is harmful to health. Smoking is associated with the main causes of death in the world. A long-term active smoker loses, on average, 10 years of life.

Health conditions

- + You replied that you have some health problems/concerns, so you should be followed up by your doctor and/or health team.

Weight changes

High blood pressure (hypertension)

Family history of disease

- + Genetic predisposition can cause or aggravate certain diseases. Sharing your family history of illness with your healthcare team enables an early diagnosis and the adoption of a personalized care plan, minimizing risks.
- Cardiaca | AVC
- + If someone in your immediate family has cardiovascular disease, you should assess your individual risk with your doctor.

Cardiovascular risk factors

High blood pressure

Smoking

Family history

- + Cardiovascular diseases are one of the major causes of mortality and poor quality of life.
- + The main risk factors are: high blood pressure, high cholesterol, diabetes, overweight, large waist circumference, smoking and a family history of disease. Keep a proactive surveillance of these risk factors.
- + When 1 risk factor exists, cardiovascular risk is already considered to exist.

Health habits and lifestyle

- + A healthy lifestyle is essential to have quality of life, today and in the future, which implies having a healthy and balanced diet, avoiding sedentary behavior and practicing physical exercise, controlling the levels of stress, maintaining good sleep routines, avoiding alcohol consumption and not smoking.
- + Your daily choices make a difference.
- + Your answers indicate that you should review your habits and lifestyle.

What would you like to improve in your health?

- + Hospital da Luz has multidisciplinary teams that can follow you up and guide you in everything related to your health.
- + Quit smoking

+ Choose here your health team +
