

Welcome to the Preventive Medicine and Longevity Center

- + This is the summary of your answers to the Health Checker, registered on november 15 in 2023.

The results of the Health Checker are based on your answers. This report is not a medical diagnosis, nor is intended to replace clinical assessment performed by a health professional.

Biometric data and other information

Female

AGE

>70

WEIGHT

22 Kg

HEIGHT

2,20 m

BMI

4,5

(Body Mass Index)

BODY FAT CONCENTRATION

-

SMOKING LOAD

0,2

(Pack units per year)

YEARS W/O SMOKING

<1

- + At this age, it is critical to be physically and mentally active. The follow-up by a dedicated medical team, with strict surveillance, allows the control of chronic diseases and helps maintain the maintain the quality of life.
- + Your BMI (Body Mass Index) value indicates that you are below normal body weight (less than or equal to 18.5 kg/m²). However, please note that this index does not distinguish lean mass, fat mass, bone density and fluids, nor their distribution. The interpretation of the BMI should be associated with other indicators such as: waist circumference, and any particular health condition, or other physiological state (example: pregnancy or postpartum).
- + You have not chosen any of the images presented. You should know that the risk of cardiovascular and metabolic diseases increases when the waist circumference is greater than 80 cm in women and 94 cm in men.
- + The smoking load is the quantification of tobacco exposure throughout life. A pack-year unit is equivalent to one pack of cigarettes smoked everyday, for a year. The greater the smoking load, the higher the risk of diseases associated with smoking. To quit smoking was an important decision. Note that after 10 years, the risk of lung cancer reduces by half, and after 15 years, the risk of coronary disease is similar to that of a non-smoker.

Health conditions

- + You replied that you have some health problems/concerns, so you should be followed up by your doctor and/or health team.

Other concerns

Other conditions

Family history of disease

- + Genetic predisposition can cause or aggravate certain diseases. Sharing your family history of illness with your healthcare team enables an early diagnosis and the adoption of a personalized care plan, minimizing risks.
- None of the presented options
- + You replied that you have no family history of cancer, neurological and cardiovascular disease.

Cardiovascular risk factors

- + The existence of cardiovascular risk factors was not indicated.
- + Cardiovascular diseases are one of the major causes of mortality and poor quality of life.
- + The main risk factors are: high blood pressure, high cholesterol, diabetes, overweight, large waist circumference, smoking and a family history of disease. Keep a proactive surveillance of these risk factors.

Health habits and lifestyle

- + A healthy lifestyle is essential to have quality of life, today and in the future, which implies having a healthy and balanced diet, avoiding sedentary behavior and practicing physical exercise, controlling the levels of stress, maintaining good sleep routines, avoiding alcohol consumption and not smoking.
- + Your daily choices make a difference.
- + Your answers indicate that you have an adequate lifestyle, with aspects that you can improve.
